Patio Paving Stain

EASY RENOVATION

Paved areas and garden paths are a key feature in many outdoor spaces. While paving is durable and low maintenance, it can become weathered and worn over time. With Patio Paving Stain, you can restore the rich, even colour of previously dyed paving stones or give bare concrete slabs a completely new look.

Easy and quick to apply, the stain is water-based and penetrates the surface without forming a film. It enhances the natural texture of the stone without making it slippery, helping maintain the original character of your outdoor space. Patio Paving Stain is available in 10 natural shades:

Instructions for use

Preparation:
Thoroughly clean the surface to remove dirt, dust, moss, and lichen. Use a pressure washer, cleaning agent and brush if needed.

For newer paving stones or slabs, apply enough pressure and water to ensure the surface becomes porous and ready to absorb the stain.

Application:
Stir the stain well before and during use. Apply evenly across the surface in one continuous process to avoid overlapping marks.

Ensure the stain is absorbed consistently into the material — do not apply a thick, paint-like layer. The product can be applied using a brush, roller, or sprayer. If using a sprayer, finish the application by going over the area with a brush or roller to help the stain soak into the surface pores.

Undyed garden stones and slabs:
Apply 1–2 coats of stain, depending on the surface's absorbency and your desired finish. In most cases, two coats will provide the best result. If needed, the stain can be diluted with up to 50% water.

Pre-coloured (dyed) garden stones and slabs:
Select a stain shade that closely matches the original colour of the stones. Apply 1–2 coats as required, depending on absorbency and the look you want to achieve. Usually, one coat is sufficient. The stain can be diluted with up to 50% water if necessary.
